

# Helping SMEs decarbonise transport & become more energy efficient | UK Power Networks

The transport decarbonisation revolution has begun. Regulations affecting sales on petrol and diesel vehicles are being introduced across the UK. We can work with you to help your business be better prepared for the transition and get access to the benefits and incentives for low emission transport, whether electric or another technology. We can offer you tailored support, advice and testing of smart solutions which could make it easier and cheaper for your organisation to make the switch. This is a chance to **get your voice heard**, and ensure your transition is as **smooth and seamless** as possible.

**UK Power Networks** operates and maintains the electricity distribution networks within the East, South East and London regions, and UK Power Networks is responsible for connecting newly installed charge points to your local power network. We do not generate or buy electricity, nor do we sell it to customers. We make sure electricity travels from generation to homes and businesses and back into the grid.

**We need your help** – by completing our survey, you can help us understand more about how we could help meet your future electric vehicle charging needs, whether you intend to switch to electric now or in the coming years.

## How taking our survey can help your SME:

**Gain access to charging suited to your needs**

**Help lower costs of connections for electric vehicles**

**Optimise energy efficiency and maximise reliability**

**Answer your questions about electric vehicle connections**
